Aluminium domes for bulk storage

CTS aluminium domes are the ideal solution for dealing with challenging environmental enclosure. Whether it is keeping the elements out or getting the largest amount of bulk in the smallest amount of space, an aluminium dome has proven to be the optimal solution. Domes offer the ideal span-to-rise ratio in standard and custom designed configurations for any clearance requirement.

Light and strong

The light weight reduces the foundation cost. When applications require, aluminium domes can even be designed to support heavy process equipment.

Large clear spans

The possibility to cover large diameters of up to 270m (900ft) in diameter offers unique solutions for material handling and protection of the environment. The free span structure does not have columns no trusses or internal supports that interfere with equipment or transfer of stored materials. Our dome structures are strong enough to support the suspensions of concentrated equipment loads and able to withstand even the harshest climates.

Solutions

- Keeps contaminants out of the treatment process
- Moderates process temperatures
- Fully compatible with all waste water effluents
- Installation in service

Architectural domes

The aluminium dome is a unique triangulated space truss skinned with aluminium panels secured by a patented batten closure system. With an ability to offer clear spans from 10 to more than 300 meter aluminium domes are specified for large covers area's such as churches, sports arenas, exhibition centres. Aluminium domes are as beautiful as they are efficient and durable. Aluminium integrated structural frames are permanent and lightweight. Optional panel systems offer eye-dazzling options.

Self-supporting structure

Geodesic domes are entirely self-supporting. Depending on the design and the supporting structure reaction forces at the base supports of the dome are minimal. For this reason many of our domes are installed on PTFE-covered sliding supports. The dome itself is strong enough to deal with its own internal forces. In other cases however support walls are used to distribute loads from fixed bearing points of the dome. Any dome will be designed to deal with local circumstances, and to comply with local engineering codes and building regulations.

ALUMINIUM DOME ROOFS

Sustainability

CTS GROUP

ALUMINUM DOME ROOFS

The eye catching aesthetic view of aluminium domes has become a dominant sight in many parts of the industry and architecture. The light and strong structure is suitable for covering storage tanks, bulk storage facilities and can be used to create impressive architectural solutions. From the blazing Mojave Desert to the humidity of Singapore and the gale force winds and snow of the Antarctic, aluminium domes have repeatedly proven their strength, durability and flexibility.

Installation

Domes can be installed in many different ways, depending on the site conditions, their diameter or size and the available time for installation. There are very few structures however that come close to the few man hours required for installation. The installation crews and experienced supervision that we offer enable you to take full advantage of these benefits. Our experience also allows us to engineer and produce domes in a very short time.

Unique batten bar design

The unique and patented batten bar design of an aluminium dome is a true asset. The used materials will not deteriorate under ultra-violet light or elevated temperatures. This is not only the basis for a leak-free dome structure, but it also adds structural strength to the dome roof.

Solutions

- Able to withstand high loads by providing greater stiffness and strength to weight ratio than any other dome geometry system, like snow loads up to 7.9 kN/m² (165 psf) and wind speeds of up to 240 km/hr (150mph)
- Maintenance free, as the permanent aluminium exterior never rusts, degenerates nor degrades
- The built-in advantages and beauty of an aluminium dome will be appreciated for years to come
- Light weight and free-span structure manufactured from aluminium and stainless steel
- Full installation and project support available

Dome roofs for storage tanks

The lightweight economical covering solution is ideal for covering steel external floating roofs, as cover for new tanks or even for replacement of the more traditional steel roofs on storage tanks. CTS offers a full solution from engineering to supply and installation, which is the only way to truly get all benefits domes have to offer. With over 1,500 domes supplied worldwide CTS is the leader in engineering supply and installation of these state of the art covering solutions.

Aluminium domes, standards and safety

Our aluminium domes are fully compliant with API 650, EN14015, EN 1991 and EN 1999 and EEMUA 159.

Engineering

During the engineering phase our team of engineers will review local load requirements and all combinations (Live-, wind-, snow-, seismic load etcetera). Also safety aspects are taken into consideration, this includes ATEX and NFPA. Completely in line with our sustainability vision all emission requirements will play a major role in the decisions we make in the design phase.

Sliding bearing

As a standard our aluminium domes will be equipped with a sliding support on a low friction PTFE (Teflon®) pad. This will reduce forces on the top of the tank.

Water and vapour tightness of an aluminium dome

Aluminium Domes can also be built fully vapour tight. Generally a dome is installed as a free vented roof, it is possible supply a dome suitable for Nitrogen blanketing or internal pressures up to 9" (230mm) water column.

Solutions

- Clear span
- Light weight
- Reduces the effect of the elements (sun, rain, wind and lightning)
- Effectively reduces emissions from storage
- Optimal total cost of ownership
- Can be adjusted for any possible climate

Highlights

- Truly maintenance free
- Short installation time (shortest in the market) with experienced crews
- Low total cost of ownership
- Guaranteed water tight
- Turn key solution, engineering, supply and installation
- Maximised service life (more than 50 years)

Aluminium dome roofs for wastewater plants and sewage treatment

For covering clarifiers, trickling filters, basins and many other vital parts of a sewage treatment plant an aluminium dome structure is the perfect covering solution. These free span, light weight and rust free covers will eliminate emissions and stench. They will also contribute to sustaining a controlled process environment. CTS offers a full solution from engineering to supply and installation, which is the only way to truly get all benefits domes have to offer. With over 1,500 domes supplied worldwide CTS is the leader in engineering supply and installation of these state of the art covering solutions.

Why aluminium

Waste water atmospheres can be very aggressive and corrosive. Research and experience with our products has shown that aluminium will deal with these circumstances perfectly. It is even compatible with high sulphurous atmospheres. This makes aluminium technically and economically the best solution for covering facilities in urban areas.

Flat covers

CTS aluminium flat covers offer many practical advantages over traditional covers. Unlike concrete they can be removed easily and they do not degenerate. They are lightweight and they do not corrode. Nor do they degrade under UV- and Ozone exposure like most of the other materials available. An aluminium flat cover installed to last for extensive periods of time without any maintenance.

Suspended covers

In certain applications the volume of air to be treated could generate a concern. The lesser the volume to be treated, the lower the treatment costs. To facilitate this drive for lower cost of ownership on air treatment facilities we offer suspended or truss supported covers. There minimise treated volumes.

Structure and appurtenances

Besides all the advantages mentioned earlier our aluminium structures will be able to deal with existing structures like bridges, access areas, ducting and others. Engineering will revolve around a minimum in changes to the actual waste water plant and the way it is operated.

Solutions

- Keeps contaminants out of the treatment process
- Moderates process temperatures
- Fully compatible with all waste water effluents
- Installation in service

Internal floating roofs (IFR) for storage tanks, Full contact type

The most efficient solution for reduction of VOC (Volatile Organic Compound) emission on storage tanks is the direct contact IFR. Full contact Internal floating roofs (IFR's) eliminate these emissions at the source.

The roof covers the majority of the surface of the stored product and therefore prevents formation of vapours. This solution is categorised as BACT (Best Available Control Technique) CTS full contact internal floating roofs are manufactured from aluminium or stainless steel modules. These modules are bolted together on site, so no welding is required. This emission reduction solution maximises tank capacity, while reducing emission to almost zero. CTS offers a full solution from engineering to supply and installation, which is the only way to truly get all benefits these solutions have to offer. With over 7,000 floating roofs supplied worldwide CTS is the leader in engineering supply and installation of these solutions.

Engineering

During the engineering phase our team of engineers will review all aspects

of the specific tank and the location where the roof is installed. We will also select the optimum seal for your application. Our engineering service includes assessment of emission requirements per API, EN, BREF IPPC, EPA and EEMUA 159 and local codes such as PGS 29 or Vlareem. CTS will also make an emission assessment and inspect the actual emission after installation of the floating roof solution to ensure full compliance. Completely in line with our sustainability vision we will strive to ensure optimal emission reduction during the service life of the IFR.

Support and assistance

We hope this leaflet triggers more questions. Our team of experts will be happy to support and assist you in selecting the optimal solution for your specific requirement.

Solutions

- High quality full contact roof
- No maintenance
- Compatible with all products stored, including 100% aromatics
- Suitable for between 6 and 120 meters diameter
- All common tank seal designs can be installed
- Available in Aluminium and stainless steel

Highlights

- Reduction of VOC emission exceeding all major relevant codes and guidelines
- No vapour on the covered area
- Suitable for rim fire protection only (often deluge systems are also not required)
- Designed for each specific tank
- Strong and durable
- Short installation time with experienced CTS crews
- Suitable for many operational activities such as high pump speeds, pigging and mixing
- Expected service life more than 30 years

INTERNAL FLOATING ROOFS

Sustainability

INTERNAL FLOATING ROOFS

The most noteworthy challenge when storing bulk liquids is prevention of emission of VOC (Volatile Organic Compounds). CTS offers a range of products that are perfectly suited to deal with this challenge. We offer a very efficient full contact roof and a high quality pontoon type internal floating roof. We supply a complete solution from engineering to delivery and installation, which is the only way to truly get all benefits these solutions have to offer. With over 7,000 floating roofs supplied worldwide, CTS is the leader in engineering supply and installation of these solutions.

Installation

During the engineering phase our team of engineers will review all aspects of the specific tank and location the roof is fitted. We will also select the optimum seal for your application. Our engineering service includes assessment of emission requirements per API, EN, BREF IPPC, EPA and EEMUA 159 and local codes such as PGS 29 or Vlare. CTS will also make an emission assessment and inspect the actual emission after installation of the floating roof solution to ensure full compliance.

Completely in line with our sustainability vision we will strive to ensure optimal emission reduction during the service life of the IFR.

Full contact roofs

The most efficient solution for reduction of VOC (Volatile Organic Compound) emission on storage tanks is the direct contact IFR. Full contact Internal floating roofs (IFR's) eliminate these emissions at the source. The roof covers the majority of the surface of the stored product and therefore prevents formation of vapours.

This solution is categorised as BACT (Best Available Control Technique). CTS full contact internal floating roofs are manufactured from aluminium (other materials are available upon request). The modules are bolted together on site, so no welding is required. This emission reduction solution maximises tank capacity, while reducing emission to almost zero.

Solutions

- High quality unsinkable full contact roof
- No maintenance
- Compatible with all products stored, including 100% aromatics
- Suitable for between 6 and 120 meters diameter
- All common tank seal designs can be installed
- Available in different grades of aluminium (other materials available upon request)

Highlights

- Reduction of VOC emission exceeding all major relevant codes and guidelines
- No vapour on the covered area
- Suitable for rim fire protection only (often deluge systems are also not required)
- Strong and durable
- Short installation time with experienced CTS crews
- Suitable for many operational activities such as high pump speeds, pigging and mixing
- Expected service life more than 30 years

Internal floating roofs (IFR) for storage tanks, Pontoon type

Pontoon type internal floating roofs (IFR) eliminate VOC emissions by saturating vapour and preventing new vapour to form. These skin and pontoon IFR are designed as light weight floating structure sealed with a closed skin. This design will reduce emission with more than 98%. It is categorised as BACT (Best Available Control Technique).

Proven efficiency

Our pontoon type IFR's are tested in the factory. Overall emission reduction will typically be at least 98%. Upon request details of these emission measurements can be made available.

Support and assistance

We hope this leaflet triggers more questions. Our team of experts will be happy to support and assist you in selecting the optimal solution for your specific requirement.

Solutions

- No maintenance
- Compatible with all products stored, including 100% aromatics
- Suitable for between 6 and 120 meters diameter
- All common tank seal designs can be installed
- Available in Aluminium, Hybrid and Stainless Steel

Highlights

- Reduction of VOC emission compliant to all major relevant codes and guidelines
- Designed for each specific tank
- Optimal strength against minimum cost
- Short installation time with experienced CTS crews
- Suitable for many operational activities such as high pump speeds, pigging and mixing
- Expected service life more than 30 years

CTS6 Liquid filled primary seal

The CTS6 liquid filled primary seal consists of a wear resistant ribbed envelope containing a liquid filled tube. The inside tube can be filled with any hydrocarbon or water, subject to requirements. The flexibility of the tube and the ribbed surface of the envelope will ensure an excellent long term vapour tightness.

CTS' manufactured liquid filled seals are custom designed and manufactured for each individual order and tank which eliminates problems that are common with off-the-shelf types of seals. The tank-specific design ensures a seal with a superior performance.

CTS can inspect your seals with our infrared gas detection Camera. This inspection is the basis for an analysis of the seal performance. This can play a material role in avoiding excessive emissions or rim-fires.

CTS40 Double compression plate seal

The CTS40 is a double rim mounted compression plate tank seal (primary and secondary seal). Its design is based on compression plates pushing a rubber tip against the tank shell. Behind the compression plates, fully shielded from weather exposure a vapour barrier fabric ensures the vapour tightness of the seal.

Our CTS40 seal is available in many different configurations. The tip configuration as well as the seal design are subject can be changed depending on the service requirements and actual tank conditions.

Highlights

- Maintenance free and fire safe design
- Compatible with all stored products, including 100% aromatics
- Eliminates virtually all rain water ingress to the stored product
- Available in different material combinations, including stainless steel and galvanized steel
- Maximum service life (more than 30 years)
- Designed for each specific tank
- The optional drip skirt makes the seal liquid mounted

RIM SEALS PRIMARY SEALS

Sustainability

CTS GROUP

RIM SEALS PRIMARY SEALS

CTS seals offer an optimal solution for reduction of emission in the area between an external floating roof and the tank shell. Every tank is different and operating conditions vary significantly. Local requirements on emission reduction also play a major role and finally tank seals play a key role in prevention of rim fires and can therefore be regarded as safety critical equipment.

Within this challenging playing field of legislation, technical and safety requirements CTS has a proven track record in supplying the optimal sealing solution. The range of seals we provide combines efficient design with optimum sealing throughout the complete rim gap.

Standards and safety

CTS tank seals comply with all international standards such as API, EN, BREF IPPC, EPA, ATEX and NFPA as well as with specific requirements such as EEMUA, PGS 29 and VLAREM.

Engineering

During the engineering phase our team of engineers will review local emission requirements, safety aspects and tank geometry to tailor the seal to each specific tank. All other important properties, such as material selection are taken into consideration for optimal performance of the seal. This ensures a long term maintenance free service life. Seal materials have to withstand the stored product as well as the elements

for longer periods of time. Our solutions will be suitable for dealing with these specific conditions.

Completely in line with the sustainability vision all emission requirements will play a major role in the decisions we make during design.

Complete solution

We offer a complete package from engineering to commissioning. We will provide an installed seal, experienced supervision or supply installation drawings, installation manual and advice for local crews to install the seal.

Support and assistance

We hope this leaflet triggers more questions. Our team of experts will be happy to support and assist you in selecting the optimal solution for your specific sealing situation.

Primary seals

The first barrier against emission in the rim area of an external floating roof is the primary rim seal. It also serves as a safety device reducing the risk of combustible vapours in this area. The design of these primary seals is therefore very important, our seals solutions provide an optimal combination of reliability and performance with a low total cost of ownership. We offer a full range of primary seals in all common seal design types in a wide variety of materials, including all grades of stainless steel and galvanised steel.

Design and engineering

Our primary seals are available in many different configurations. The seal design can be changed depending on the service requirements and actual tank conditions.

Solutions

- Liquid mounted gas tight seal type for maximum emission reduction
- Long service life (expected more than 30 years)
- Best available emission control technology per EPA and IPPC BREF
- Increased operability in all hydrocarbons and chemicals, including 100% aromatics
- Available in many stainless steel grades and galvanised steel
- Only fire retardant sealing materials are used
- Seals can be supplied per API RP 545
- Fire safe secondary seal design available

CTS1 Liquid mounted primary shoe plate seal

Over the years our mechanical shoe plate seal has proven to be one of the most resilient and versatile solutions for sealing the gap between the tank shell and floating roof. It combines excellent sealing characteristics with very good product compatibility.

The CTS 1 tank seal consists of metal shoe plates, supported by scissors that connect to the tank shell, these shoe plates are pushed against the shell with special leaf springs. The durable vapour barrier completes the seal.

Highlights

- Keeps contaminants out of the treatment process
- Moderates process temperatures
- Fully compatible with all waste water effluents
- Pantograph type available
- Installation in service
- Suitable for crude oil service

CTS30 Liquid mounted primary shoe plate seal

One of the innovations introduced by CTS over the years is the CTS30 compression shoe plate seal. This seal type combines the simple and low maintenance characteristics of the traditional seal with the excellent sealing efficiency of a shoe plate seal.

Uniform sealing pressure

The CTS30 uses compression plates to generate the sealing pressure against the tank shell, backed up by a stainless steel leaf spring. Between the seal plates and the backup springs a vapour barrier made of PTFE ensures the vapour tightness of the seal. The basic design will be tailored to each specific tank. This combination of innovative technology and consideration for specific tank geometry makes our compression shoe sealing system the best available technology for emission reduction on floating roof tanks.

Highlights

- Fire safe and maintenance free seal design
- Optimum emission reduction
- Maximum service life (more than 30 years)
- Can be equipped with wax scrapers
- Universal seal

CTS7 Primary foam seal

The foam seal is one of the most effective primary tank seals when considering emission reduction. With this sealing system the resilient foam core provides a uniform sealing force regardless of the shape of the tank shell. A hold down plate and reinforced polymer fabric provide maximum sealing pressure against the tank shell. This seal has a large contact area and is therefore a very tight seal. Primary foam seals can either be vapour mounted or liquid mounted.

The liquid mounted foam seal completely avoids vapour formation, but the direct contact between the liquid and the seal envelope makes the requirements for the envelope material much more demanding. When executed in vapour mounted variation the foam seal is not in direct contact with the product, which reduces the requirements for the envelope.

Our CTS 7 foam seal can be designed with different foam core materials and shapes to create a seal with optimal characteristics for the tank it will be fitted on.

Highlights

- Maximum emission reduction
- Available in vapour mounted or liquid mounted execution

Internal floating roof seals

Internal floating roof seals require special attention during the design phase. As inspection is often difficult, durability and reliability of these seals are very important. CTS has wide experience in these seals, which ensures a long term optimal performance without the need for maintenance or inspection.

CTS 50 foam seal

The foam seal is one of the most effective primary tank seals when considering emission reduction. The CTS 50 is specifically tailored for internal floating roofs, where the weight and height are adapted to the internal floating roof design. The foam core offers a uniform sealing pressure regardless of the shape of the tank shell. This seal has a large contact area and is therefore a very tight seal. Primary foam for internal floating roofs are liquid mounted.

Features

- Excellent vapour tightness, resulting in maximum emission reduction
- Liquid mounted seal design

CTS 60 and CTS 70 wiper seal

The CTS wiper seal is the most economic seal for internal floating roof. The polyethylene wiper provides an effective seal against the tank shell. It complies to all relevant codes and specifications.

Highlights

- Efficient design
- Available in primary (CTS60) and double (CTS70) design
- Vapour mounted

CTS 80 compression plate seal

One of the innovations introduced over the years is the internal floating roof compression shoe seal. This seal type combines the simple and low maintenance characteristics of the compression plate seal with the excellent sealing efficiency of the shoe plate seal.

The CTS80 has the same design basis when compared to the CTS 30. This basic design will be tailored to each specific internal floating roof. This combination of innovative technology and consideration for specific tank geometry makes our compression shoe sealing system the best available technology for emission reduction on external floating roof tanks.

Highlights

- Optimal service life (more than 30 years)
- Fire safe and maintenance free seal design
- Turn key solution engineering, supply and installation available
- Wax scraper for heavy or waxy products available (CTS80W)

CTS 90 mini shoe seal

Over the years our mechanical shoe plate seal has proven to be one of the most resilient and versatile solutions for sealing the gap between the tank shell and floating roof. It combines excellent sealing characteristics with very good product compatibility.

The CTS 90 tank seal consists of metal shoe plates that connect to the tank shell, these shoe plates are supported by with scissors and pushed against the shell with special leaf springs. The durable vapour barrier completes the seal.

Highlights

- Optimal service life (more than 30 years)
- Wax scraper for heavy or waxy products available (CTS90W)

RIM SEALS SECONDARY SEALS

CTS seals offer an optimal solution for reduction of emission in the area between an external floating roof and the tank shell. Every tank is different and operating conditions vary significantly. Local requirements on emission reduction also play a major role and finally tank seals play a key role in prevention of rim fires and can therefore be regarded as safety critical equipment.

Within this challenging playing field of legislation, technical and safety requirements CTS has a proven track record in supplying the optimal sealing solution. The range of seals we provide combines efficient design with optimum sealing throughout the complete rim gap.

Standards and safety

CTS tank seals comply with all international standards such as API, EN, BREF IPPC, EPA, ATEX and NFPA as well as with specific requirements such as EEMUA, PGS 29 and VLAREM.

Engineering

During the engineering phase our team of engineers will review local emission requirements, safety aspects and tank geometry to tailor the seal to each specific tank. All other important properties, such as material selection are taken into consideration for optimal performance of the seal. This ensures a long term maintenance free service life. Seal materials have to withstand the stored product as well as the elements

for longer periods of time. Our solutions will be suitable for dealing with these specific conditions.

Completely in line with the sustainability vision all emission requirements will play a major role in the decisions we make during design.

Complete solution

We offer a complete package from engineering to commissioning. We will provide an installed seal, experienced supervision or supply installation drawings, installation manual and advice for local crews to install the seal.

Support and assistance

We hope this leaflet triggers more questions. Our team of experts will be happy to support and assist you in selecting the optimal solution for your specific sealing situation.

Solutions

- Liquid mounted gas tight seal type for maximum emission reduction
- Long service life (expected more than 30 years)
- Best available emission control technology per EPA and IPPC BREF
- Increased operability in all hydrocarbons and chemicals, including 100% aromatics
- Available in many stainless steel grades and galvanized steel
- Only fire retardant sealing materials are used
- Seals can be supplied per API RP 545
- Fire safe secondary seal design available

Secondary seals

We offer a full range of secondary seal solutions. Secondary seals need to combine several aspects that can sometimes be contradicting and therefore many designs are available depending on the specific priorities and combinations of safety, storage conditions, stored product properties legislation and weather conditions. The most noteworthy aspect of a secondary seal is safety, a good secondary seal will effectively prevent rim fires regardless of weather conditions.

All CTS secondary seals are independent from the primary seal and can be installed on all possible rim configurations. We will design the seals specifically for each tanks it is installed on and make sure it reduces emission in the best possible way. All our secondary seals are available in a wide range of materials, including galvanized steel and different grades of stainless steel.

Design and engineering

Our secondary seals are available in many different configurations. The tip configuration as well as the seal design can be changed depending on the service requirements and actual tank conditions.

Our special tank inspection sheet will facilitate this engineering process.

Design highlights

- Greatly reduce the risk of rim fires
- Eliminate rain water in the stored product
- Expected service life in excess of 30 years
- Can be installed while the tank remains in service

CTS20 Secondary compression plate seal

The CTS 20 is the most common design for secondary tank seals. It consists of compression plates pushing a rubber tip against the tank shell. Behind the compression plates, fully shielded from weather exposure, the vapour barrier fabric ensures the vapour tightness of the seal.

Highlights

- Proven technology for secondary seals
- Optimum protection against rim fires

CTS20LP (Low Profile) secondary seal

The CTS20LP (Low Profile) is a low profile designed to have a minimal height ensuring a maximum filling capacity. The height is approximately 150-250mm above the rim of the floating roof. The compression springs push the tip against the tank shell and ensures proper sealing on this location. These springs are covered with a weather and hydrocarbon resistant antistatic fire retardant PTFE vapour fabric. This fabric supported by the springs ensures rainwater run off the seal onto the floating roof.

Self-supporting structure

A CTS20LP seal is available in many different configurations depending on the service requirements and actual tank conditions. CTS has already successfully supplied CTS20 LP seals for rim gaps over 400mm.

Highlights

- Allows for a reduced foam dam height
- Increased filling height of the tank

Drain hoses

CTS tank drain hoses are a proven solution for the challenging draining of rain water on external floating roofs. The major advantage of these hoses is its simplicity in design. It has a limited amount of connections and therefore high reliability. To avoid floating the CTS drain hose includes a lead ballast cable and suspension system. All hoses are supplied electrically continuous to prevent buildup of static electricity.

Construction

Lining	Nitrile (NBR) or Neoprene (CR)		
Reinforcement	Textile cord with a high tensile wire helix		
Cover	Smooth wrapped finish in the following materials:		
	Specification	Rubber quality	Content
	CTS604	Nitrile	Aromatic content up to 50%
	CTS608	PVC/Nitrile	Aromatic content up to 70%
	CTS603	Viton®	Aromatic content up to 100%
Flanges	Mild steel nipples with fixed ASA150 R/F Other flanges, including bronze and swivels, and material types on request		
Ballast connection	Stainless steel threaded section welded to the hose nipple		
Lead ballast	Each hose assembly incorporates a permanently attached lead covered stainless steel cable to prevent the hose from floating in the stored product. The ballast is secured with two threaded stainless steel nuts retaining the cable loop which is itself secured with two stainless steel U type clamps with double nuts. Clamps and chains for roof attachment are supplied and the roof end of each hose is marked as follows: "Attach this end to roof"		

More details and dimensions can be provided upon request.

Proven efficiency

A longitudinal white stripe is permanently branded on the cover of each hose to ensure correct alignment.

Features

- Designed for immersed use
- Suitable for 100% aromatics or corrosive liquids
- Can be equipped with spark-free flanges
- Length up to 40m
- Pressure tested and certified, before shipping
- Steel hose protectors can be supplied as an option

DRAIN SYSTEMS

Sustainability

CTS GROUP

DRAIN SYSTEMS

Especially in climates with high rainfall water can accumulate on the external floating roof. Adequate draining of this rain water is very important for safe and reliable operation of storage tanks with external floating roofs.

Drain water on external floating roofs may contain sediments and debris, which causes the drains to malfunction. Also the placement of the drains inside the stored product makes the drain design challenging. The CTS drain solutions take these important aspects into consideration. Our drain solutions include the drain master system, swivel joint system, drain hose and flextube system.

Safety and certifications

CTS drain systems comply with all relevant international standards. These systems are designed as low pressure systems, nevertheless the assembly is tested to 10 bar with water. All certificates are included in the supply.

Drain master

The drain master consists of a reinforced composite hose fitted in a metallic pivoting joint. This is an ideal long-lasting flexible pipe connection for this application.

Construction

Hose	
Inner wire	SS316 (1.4401)
Lining	Polypropylene (PP)
Outer cover	Hostafion (PTFE with PE added for maximum tightness)
Outer wire	SS316 (1.4401)
Operating pressure	Max. 14 bar
Vacuum	Suitable for vacuum up to -0.85 bar
Temperature range	-20°C up to +100°C

Internal diameter	A (mm)	B (mm)	C (mm)	D (mm)	Weight (kg)
3"	615	310	230	195	35
4"	750	375	270	235	47,5
6"	950	475	365	310	85
8"	1,300	650	430	385	135

Highlights

- Drainmaster flexible connections can be supplied in 3", 4", 6", 8", 10" and 12"
- Designed for submerged service in aggressive environments
- Maintenance free
- Service life in well in excess of 20 years
- Suitable for 100% aromatics

Flexidrain

CTS flexidrain tubes are available from 3-inch to 8-inch internal diameter. It consist of an interlocking metallic carcass, inside a barrier layer. This combination of layers allows the flexidrain to be installed in a repetitive lay pattern, which ensures the safe operation of the tank roof. All tank drain flexible lay patterns are custom engineered for each specific tank.

Key properties

- Repetitive lay pattern that is easy and relatively inexpensive to install
- No maintenance required
- Accommodation of the lowest possible operating roof position
- Compatible with 100% aromatics
- No abrasion to either tank floor or covering layer
- No swivel joints or other connections that bind or require maintenance
- No lateral forces on floating roof

Details and dimensions can be provided upon request.

Test results

Burst and tensile testing has been completed with excellent results. In the case of the 4-inch tank drain flexible both samples failed in burst mode and away from the end fittings. The actual burst pressures from testing were 33.8 and 33.9 bar respectively, and well above the predicted calculated value of 30.4 bar.

Swivel systems

Tanks drain systems can only be replaced when the tank is out of service, therefore the consequence of a malfunctioning tank drain is significant. To ensure long service life CTS has developed a tank drain pipe solution with high quality swivels. The CTS drain pipe system is a complete system, including the connections, swivels and the piping required. Please refer to the swivels leaflet for more information on our swivels.

ATTENTION: MR. OSAMA ALNAJJAR

CONTRACT NO.: 1650/404

PROJECT NAME: 1450-WATER TANKS EAST RIYADH

MATERIAL SUPPLIED: DESIGN AND SUPPLY OF ALUMINIUM DOME ROOFS FOR SIX (6)
TANKS

DEAR MR. OSAMA,

THIS IS IN REGARD TO THE RECENT COMPLETED PROJECT FOR NATIONAL WATER
COMPANY PROJECT (TGE) WHERE CTS MIDDLE EAST BAHRAIN W.L.L. SCOPE WAS FOR
DESIGN, FABRICATION, SUPPLYING AND SUPERVISE THE INSTALLATION FOR SIX (6) NOS.
OF 107M DIAMETER ALUMINIUM DOME ROOFS. WE HEREBY WANT TO EXTEND OUR
APPRECIATION TO CTS MIDDLE EAST FOR COMPLEATING THE PROJECT ACCORDING TO
THE PROJECT SCHEDULE.

WE THANK CTS AND THE PROFESSIONAL CREW SENT TO THE SITE TO CARRY THE
INSTALLATION SUPERVISION FOR ALL THE TANKS

BEST REGARDS,

ENGR. FAWAZ TORAZI

TOPIC: REGISTRATION STATUS

Dear Mr. Essenius,

We hereby confirm your company's registration with Aramco Overseas Company B.V. Your Vendor ID (sales office) is 10035416.

The in the attachment listed materials are linked to your VID.

This registration letter should not be regarded as a commitment by AOC to purchase from you. However, your company will have the opportunity along with other approved suppliers to respond to requests for submitting proposals in accordance with AOC's established policies and procedures.

AOC would like to take this opportunity and thank you for your interest in doing business with AOC/Saudi Aramco. Should you require any further information, please do not hesitate to contact our office (email: aocsupplierrelations@aramco.nl).

Yours faithfully,

Mike Hoogeboom
Strategic Sourcing Unit
Aramco Overseas Company BV

It is the responsibility of the manufacturer to notify Aramco Supplier Relations Group of the following:

- 1. Change of Name/Address*
- 2. Any change of manufacturing location (sub sourcing fabrication of major components)*
- 3. Discontinuance of fabrication of approved 9COMs*

Please use your VID code in all your correspondence with Aramco.

Subject: Aluminium Internal Floating Roofs and Geodesic Dome Roofs

Dear Mr. Essenius,

Vopak has, directly or indirectly through its contractors, in the last couple of years awarded CTS Netherlands B.V. with numerous contracts for the supply and installation of Aluminium Internal Floating Roofs, hereinafter referred to as IFR's, which have been produced by Allentech.

These IFR's have been installed on various tanks which are located on, amongst others but not limited to, Vopak Terminal Europoort and Vopak Terminal Botlek. As a result of the fact that we are very satisfied with the quality of the IFR's produced by Allentech, your company has some months ago, through our contractor, been awarded with the contract for the supply and installation of the required IFR's for Vopak Terminal Westpoort which will be constructed in Amsterdam, The Netherlands.

Due to the good level of both service and quality provided by CTS Netherlands as well as the quality of the IFR's produced by Allentech and the Aluminium Geodesic Dome Roofs, hereinafter referred to as GDR's, produced by Temcor, Vopak intends to enter into a Global Contract with CTS Netherlands B.V. for the supply and installation of the aforementioned IFR's and GDR's.

If required to conduct business you are allowed to use this letter as a reference to your customers. In addition to this I am willing to communicate with your customers should they feel the need to do so in order to answer any questions and/or address any remarks they might have.

Kind regards,

On behalf of Vopak Shared Services B.V.,

Robert van der Wal
Global Category Buyer MRO Services and Equipment
